Date: 2023-09-19

#### Aim:

Write a java program to demonstrate operator precedence and associativity Source Code:

```
OperatorPrecedence.java

import java.util.Scanner;
class OperatorPrecedence{
    public static void main(String[] args){
        int x,result;
        System.out.print("Enter a num: ");
        Scanner sc=new Scanner(System.in);
        x=sc.nextInt();
        result=x++ +x++*--x/x++ - --x+3>>1 | 2;
        System.out.println("The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2");
        System.out.println("result = "+result);
    }
}
```

# Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

Enter a num:
4

The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2

result = 3
```

Test Case - 2
User Output
Enter a num:
-3
The operation going is $x++ + x++ *x / x++x + 3 >> 1   2$
result = 2

Date: 2023-09-19

#### Aim:

write a java program that uses if-else control statement and print the result

```
Control.java
import java.util.Scanner;
class Control{
        public static void main(String args[]){
               int x,y,z;
               Scanner sc = new Scanner(System.in);
                System.out.print("Enter first num : ");
               x=sc.nextInt();
               System.out.print("Enter second num : ");
               y=sc.nextInt();
                z=x+y;
               if(z<20){
                       System.out.println("x + y is less than 20");
               }
               else{
                       System.out.println("x + y is greater than 20");
               }
        }
```

### Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter first num :
Enter second num :
x + y is less than 20
```

Test Case - 2
User Output
Enter first num :
24
Enter second num :
10
x + y is greater than 20

Exp. Name: Sample Program to demonstrate constructor

Date: 2023-09-19

Aim:

S.No: 3

Write a program to demonstrate constructor class Source Code:

```
Student.java
class Student{
        int num;
        String name;
        //method to display the value of num and name
        void display(){
               System.out.println(num+" "+name);
        public static void main(String args[]){
               //creating objects
               Student s1=new Student();
               Student s2=new Student();
               //displaying values of the object
               s1.display();
               s2.display();
        }
}
```

### Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

0 null
0 null
```

ID: 224G1A0517 Page No: 3

Write a program to demonstrate destructor class Source Code:

```
DestructorExample.java
public class DestructorExample{
        public static void main(String args[])
               DestructorExample de=new DestructorExample();
               de.finalize();
                de=null;
                System.gc();
                System.out.println("Inside the main() method");
        }
        protected void finalize()
                System.out.println("Object is destroyed by the Garbage Collector");
}
```

### Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Object is destroyed by the Garbage Collector
Inside the main() method
Object is destroyed by the Garbage Collector
```

ID: 224G1A0517 Page No: 4

#### Aim:

Write a Java program to print Half Pyramid pattern. Source Code:

```
HalfPyramid.java
import java.util.Scanner;
public class HalfPyramid{
        public static void main(String args[])
                Scanner sc = new Scanner(System.in);
                System.out.print("Enter no of rows : ");
                int rows=sc.nextInt();
                for(int i=1;i<=rows;i++)</pre>
                         for(int j=1;j<=i;j++)</pre>
                                 System.out.print("* ");
                         System.out.print("\n");
                }
        }
}
```

### Execution Results - All test cases have succeeded!

```

### Aim:

Write Java program on use of Inheritance.

Create a classVehicle

- contains the data members **color** of String type and **speed** and **size** of integer data type.
- $\bullet \ write \ a \ method \textbf{setVehicleAttributes()} to \ initialize \ the \ data \ members$

 $Create\ another\ class Carwhich\ is\ derived\ from\ the\ class Vehicle$ 

- contains the data membersccandgearsofintegerdata type
- $\hbox{\bf \cdot} \ write \ a \ method \textbf{setCarAttributes()} to \ initialize \ the \ data \ members$
- $\bullet \ write \ a \ method \textbf{displayCarAttributes()} which \ will \ display \ all \ the \ attributes.$

Write another class InheritanceDemo with main() it receives five arguments color, speed, size, cc and gears.

#### Source Code:

InheritanceDemo.java

## Execution Results - All test cases have succeeded!

b1.setCarAttributes(args[0],args[1],args[2],args[3],args[4]);

import java.util.Scanner;

class Car extends Vehicle{ int CC; int gears;

public class InheritanceDemo{

}

{

}

String color; int speed; int size;

color = c;

void setVehicleAttributes(String c,String s,String sp){

System.out.println("Color of Car : "+color);

System.out.println("Speed of Car : "+speed); System.out.println("Size of Car : "+size); System.out.println("CC of Car : "+CC);

System.out.println("No of gears of Car : "+gears);

void setCarAttributes(String c,String s,String sp,String cce,String gear){

speed = Integer.parseInt(s); size = Integer.parseInt(sp);

setVehicleAttributes(c,s,sp); CC = Integer.parseInt(cce); gears = Integer.parseInt(gear);

displayCarAttributes();

public static void main(String args[])

Car b1 = new Car();

void displayCarAttributes(){

class Vehicle{

```
Test Case - 1
User Output

Speed of Car : 100
Size of Car : 20
CC of Car : 1000
No of gears of Car : 5
```

```
Test Case - 2
User Output
```

Speed of Car : 120	
Size of Car : 25	
CC of Car : 900	
No of gears of Car : 5	

**ID: 224G1A0517** Page No: 16

write a java program to prevent inheritance using abstract class.

- Create an abstract class Shape
- Create a class Rectangle which extends the class Shape
- Class Rectangle contains a method  $\mathbf{draw}$  which prints  $\mathbf{drawing}$   $\mathbf{rectangle}$
- Create another class circle1 which extends Shape
- Class circle1 contains a method draw whih prints drawing circle
- Create a main class TestAbstraction1
- · Create object for the class circle1 and called the method draw

#### Source Code:

```
TestAbstraction1.java
abstract class shape{
        abstract void draw();
}
class Rectangle extends shape
{
        void draw()
                System.out.println("drawing rectangle");
}
class Circle1 extends shape
{
        void draw()
                System.out.println("drawing circle");
}
class TestAbstraction1{
        public static void main(String args[])
        {
                shape s= new Circle1();
                s.draw();
}
```

#### Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
drawing circle
```

Date: 2023-10-15

Aim:

Write a program on method overriding Source Code:

```
Bike.java
```

```
class Vehicle{
        void run(){
                System.out.println("Bike is good");
class Safe extends Vehicle{
        void run()
                System.out.println("Bike is running safely");
}
class Bike
        public static void main(String args[])
                Vehicle obj=new Safe();
                obj.run();
        }
```

## Execution Results - All test cases have succeeded!

```
Test Case - 1
```

**User Output** 

Bike is running safely

**ID: 224G1A0517** Page No: 20

#### Aim:

Write a Java program that implements an interface.

Create an interface called Car with two abstract methods (String getName()) and int getMaxSpeed(). Also declare one **default** method (void applyBreak()) which has the code snippet

```
System.out.println("Applying break on " + getName());
```

In the same interface include a **static** method (<u>Car getFastestCar(Car car1, Car car2)</u>), which returns **car1** if the **maxSpeed** of **car1** is greater than or equal to that of **car2**, else should return **car2**.

Create a class called BMW which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Similarly, create a class called Audi which implements the interface Car and provides the implementation for the abstract methods getName() and getMaxSpeed() (make sure to declare the appropriate fields to store name and maxSpeed and also the constructor to initialize them).

Create a **public** class called MainApp with the **main()** method.

Take the input from the command line arguments. Create objects for the classes <a>BMW</a> and <a>Audi</a> then print the fastest car.

#### Note:

Java 8 introduced a new feature called default methods or defender methods, which allow developers to add new methods to the interfaces without breaking the existing implementation of these interface. These default methods can also be overridden in the implementing classes or made abstract in the extending interfaces. If they are not overridden, their implementation will be shared by all the implementing classes or sub interfaces.

Below is the syntax for declaring a default method in an interface:

```
public default void methodName() {
    System.out.println("This is a default method in interface");
}
```

Similarly, **Java 8** also introduced <u>static</u> methods inside interfaces, which act as regular static methods in classes. These allow developers group the utility functions along with the interfaces instead of defining them in a separate helper class.

Below is the syntax for declaring a static method in an interface:

```
public static void methodName() {
    System.out.println("This is a static method in interface");
}
```

Note: Please don't change the package name.

Source Code:

q11284/MainApp.java

ID; 224G1A0517 Page No: 22

```
package q11284;
interface Car {
        public String getName();
        public int getMaxSpeed();
        public default void applyBreak(){
                System.out.println("applying Break on "+getName());
        }
        public static Car getFastestCar(Car a,Car b){
                if(a.getMaxSpeed()>b.getMaxSpeed())
                        return a;
                else
                        return b;
        }
}
class BMW implements Car {
        String name;
        int speed;
        public BMW(String n,String s){
                speed=Integer.parseInt(s);
                name=n;
        public String getName(){
                return name;
        }
        public int getMaxSpeed(){
                return speed;
        }
```

        System.out.println("After catch statement.");
    }
}
```

# $Execution \ Results \ \hbox{- All test cases have succeeded!}$

```
Test Case - 1

User Output

Exception raised -Division by zero.

After catch statement.
```

ID: 224G1A0517 Page No: 29

S.No: 20

Date: 2023-11-05

#### Aim:

Write a Java code for creating your own exception Source Code:

```
q224/demo.java
package q224;
class MyException extends Exception \{
        private int ex;
        MyException(int a){
                ex=a;
        public String toString(){
                return "MyException["+ex+"] is less than zero";
public class demo{
        static void sum(int a,int b)throws MyException{
                if(a<0)
                throw new MyException(a);
                else
                System.out.println(a+b);
        public static void main(String args[]){
                try{
                        sum(-10,10);
                catch(MyException e){
                        System.out.println(e);
```

### Execution Results - All test cases have succeeded!

Test Case - 1	
User Output	
MyException[-10] is less than zero	

ID: 224G1A0517 Page No: 30

#### Aim:

Write java program that inputs 5 numbers, each between 10 and 100 inclusive. As each number is read display it only if it's not a duplicate of any number already read. Display the complete set of unique values input after the user enters new values

#### Source Code:

Duplicate.java

ID: 224G1A0517 Page No: 31

```
if(ele == arr[i]){
                                return true;
                        }
                }
                return false;
        }
        public static void main(String[] args){
                Scanner inp = new Scanner(System.in);

S.No: 24	Exp. Name: program to create a super class called Figure that it returns the area of a rectangle and triangle	Date: 2023-11-05
----------	---	------------------

Write a java program to create a super class called Figure that receives the dimensions of two dimensional objects. It also defines a method called area that computes the area of an object. The program derives two sub-classes from Figure. The first is Rectangle and second is Triangle. Each of the sub classes override area() so that it returns the area of a rectangle and triangle respectively

ID; 224G1A0517 Page No; 44

Write a Java program that uses three threads to perform the below actions:

- 1. First thread should print "Good morning" for every 1 second for 2 times
- 2. Second thread should print "Hello" for every 1 seconds for 2 times
- 3. Third thread should print "Welcome" for every 3 seconds for 1 times

Write appropriate **constructor** in the <u>Printer</u> class which implements <u>Runnable</u> interface to take three arguments: **message**, **delay** and <u>count</u> of types **String**, **int** and **int** respectively.

Write code in the Printer.run() method to print the **message** with appropriate **delay** and for number of times mentioned in **count**.

Write a class called ThreadDemo with the main() method which instantiates and executes three instances of the above mentioned Printer class as threads to produce the desired output.

**INote:** If you want to sleep for **2** seconds you should call (Thread.sleep(2000);) as the (Thread.sleep(...)) method takes milliseconds as argument.]

Note: Please don't change the package name.

This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

## Execution Results - All test cases have succeeded!

#### Test Case - 1

#### **User Output**

#### New string

Previous string: This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

New String: New string. The test string is replaced with your input string, check the string you entered is now visible here.

Exp. Name: A java program to demonstrate that S.No: 27 the catch block for type Exception A catches the exception of type Exception B and Exception C.

Date: 2023-11-05

#### Aim:

Use inheritance to create an exception superclass called Exception A and exception subclasses Exception B and Exception C, where Exception B inherits from Exception A and Exception C inherits from Exception B. Write a java program to demonstrate that the catch block for type Exception A catches the exception of type Exception B and Exception C.

Note: Please don't change the package name.
